# pSemi Reliability System

The Quarterly Reliability Report is a compilation of reliability stress test results that crosses the entire product & technology family of pSemi products. Data is collected on a regular basis through the efforts of product and process qualifications, standard product monitoring and lot acceptance testing. To date, a total of **158,357 devices** have been tested in HTOL with a total of **9.76 billion equivalent device hours**. The overall failure rate for the pSemi family of products is **0.09 FIT**. (Using Eaa = 0.7eV, Tj=55°C at 60% UCL)

pSemi reliability testing standards conform to industry standard qualification procedures as detailed in the JEDEC guidelines. In addition, where clear guidelines have not been established yet, pSemi has developed stringent reliability requirements to ensure consistent high reliability performance.

pSemi makes use of accelerated life testing results, along with thermal acceleration factors in the prediction of failure rates. High Temperature Operating Life (HTOL) stress testing is performed at accelerated voltage and temperature conditions which are based Jedec-JESD22-A108 standards. Resulting data collected from HTOL tests is de-rated to a typical use operating junction temperature (Tj) of 55°C. Early Life Failure Rate (ELFR) is derived after 48-hr performance.

pSemi conducts an ongoing product reliability monitoring program to evaluate sample products from high volume, major product families on a quarterly basis. The reliability monitoring process is a continuously improving system within pSemi as we strive for superior product knowledge and performance.

pSemi performs the majority of Reliability testing using an ISO17025 certified test laboratories located in San Jose, CA. Regular auditing of the laboratory is performed to ensure compliance to ISO standards.

# Failure Rate Calculation

## Acceleration Factor (AF)

For a given failure mechanism, acceleration factor (AF), is the ratio of the time it takes for a certain fraction of the population to fail, following application of one stress or use condition, to the corresponding time at a more severe stress or use condition.

The industry uses the thermal acceleration model formula based on Arrhenius equation noted below:

---

$$AF(T_{use}, T_{stress}) := e^{\frac{E_{aa}}{k_B} \cdot \left( \frac{1}{T_{use}} - \frac{1}{T_{stress}} \right)}$$

where:

$E_{aa} := 0.7 \text{ eV}$ , is the Apparent Activation Energy

$e = 2.718$ , is the base of natural logarithm

$k_B := 8.62 \cdot 10^{-5} \frac{\text{eV}}{\text{K}}$ , is the Boltzmann constant

$T_{use}$  &  $T_{stress}$ , are the use and stress test temperatures, respectively, in Kelvin

---

## Sample Calculation

Find the Acceleration Factor (AF) with the following conditions.

(a)  $T_{use} := 55 \text{ }^{\circ}\text{C}$  and  $T_{stress} := 125 \text{ }^{\circ}\text{C}$

$$AF(T_{use}, T_{stress}) = 77.5$$

(b)  $T_{use} := 55 \text{ }^{\circ}\text{C}$  and  $T_{stress} := 150 \text{ }^{\circ}\text{C}$

$$AF(T_{use}, T_{stress}) = 258.7$$

# Failure Rate Calculation (continued)

## Failure in Time Calculation

Mean time to failure (M.T.T.F.) is defined as the average time it takes for a failure to occur. Failure in Time (F.I.T.) is the number of units predicted to fail in a billion ( $1e^9$ ) device hours at a specified temperature. After the life test is completed and accelerated device hour data is calculated, the failure rate is estimated using the Chi-Square follows:

$$FIT = \left( \frac{\chi^2(2r+2)}{2 * EDH} \right) * 1e^9 \quad \text{approximation } (\chi^2) \text{ as}$$

where:

$\chi^2$  = chi square function

r = number of failures

EDH = equivalent device hours (units tested x test hours x AF)

## Sample Calculation

Given: Units Tested (Sample Size) = 231 devices

Test temperature = 150°C

Test duration = 500 hours

Failures = 0

EDH =  $(231 \times 500 \times 259.2) = 2.99E+7$  equivalent device hours

$\chi^2$  @ 60% confidence level and 0 failures = 1.83

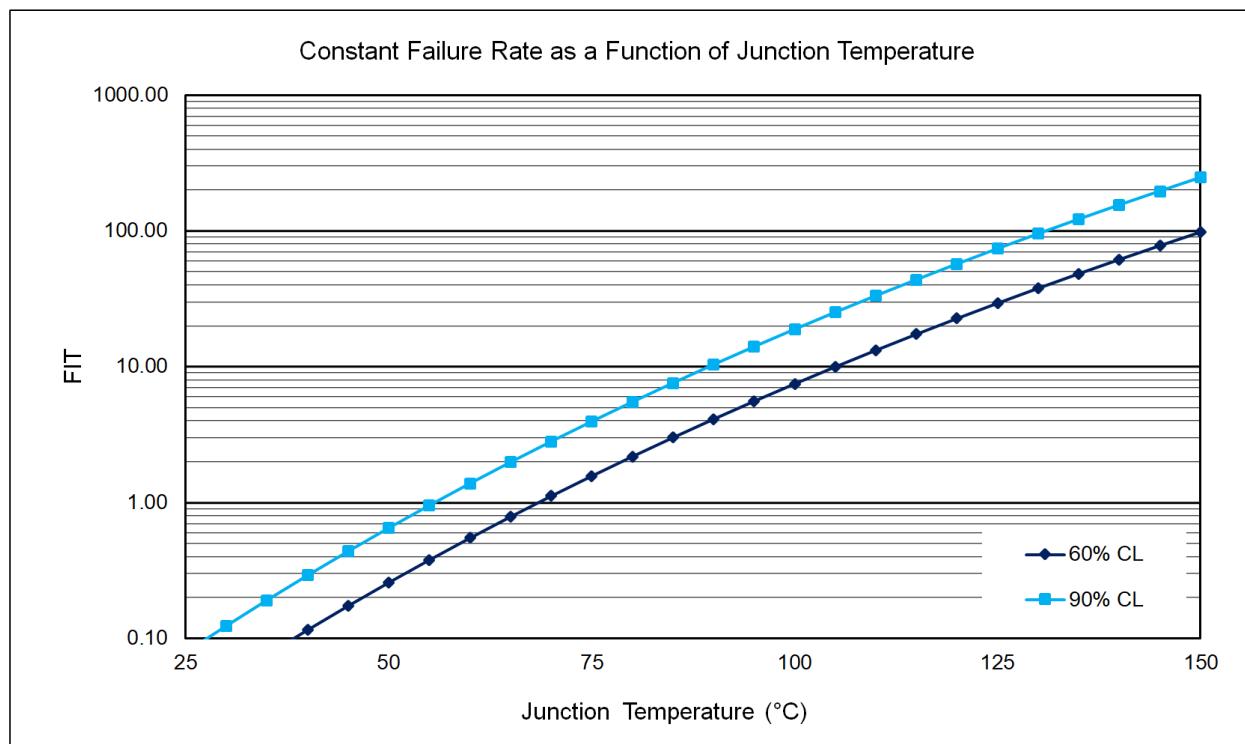

FIT (60% confidence level) =  $[1.83 / (2 \times 2.99E+7)] \times 1.0E+9 = \underline{30.6 \text{ FIT}}$
