

# PE83342

**Military Operating Temperature Range** 

# **Product Description**

Peregrine's PE883342 is a high performance integer-N PLL with embedded EEPROM capable of frequency synthesis up to 2.7 GHz with a speed-grade option to 3.0 GHz. The EEPROM allows designers to permanently store control bits, allowing easy configuration of self-starting synthesizers. The superior phase noise performance of the PE83342 is ideal for applications such as wireless base stations, fixed wireless, PMR, UAV, and RF instrumentation systems.

The PE83342 features a ÷10/11 dual modulus prescaler, counters, and a phase comparator as shown in Figure 1. Counter values are programmable through a three-wire serial interface.

The PE83342 is optimized for stringent military applications. Fabricated in Peregrine's patented UTSi® (Ultra Thin Silicon) CMOS technology, the PE83342 offers excellent RF performance with the economy and integration of conventional CMOS.

# 2.7 GHz Integer-N PLL with Field-Programmable EEPROM

#### **Features**

- Field-programmable EEPROM for self-starting applications
- Standard 2.7 GHz operation
- ÷10/11 dual modulus prescaler
- Internal phase detector
- Serial programmable
- Low power 30 mA at 3 V
- Ultra-low phase noise
- Available in 24-lead Plastic TSSOP package

**Table 1. Pin Descriptions** 

| Pin No.<br>TSSOP | Pin No.<br>MLPQ | Pin Name         | Туре       | Description  |
|------------------|-----------------|------------------|------------|--|
| 1                | 19              | $V_{DD}$         | (Note 1)   | Power supply input. Input may range from 2.85 V to 3.15 V. Bypassing required.   |
| 2                |                 | GND              | (Note 2)   | Ground.  |
| 3                | 20              | ENH              | Input      | Enhancement mode control line. When asserted LOW, enhancement register bits are functional. Internal $70k\Omega$ pull-up resistor.   |
| 4                | 1               | S_WR             | Input      | Secondary Register WRITE input. Primary Register contents are copied to the Secondary Register on S_WR rising edge. Also used to control Serial Port operation and EEPROM programming.   |
| 5                | 2               | Data             | Input      | Binary serial data input. Input data entered LSB (B <sub>0</sub> ) first.  |
| 6                | 3               | Clock            | Input      | Serial clock input. Data is clocked serially into the 20-bit Primary Register, the 20-bit EE Register, or the 8-bit Enhancement Register on the rising edge of Clock. Also used to clock EE Register data out Dout port.       |
| 7                |                 | GND              | (Note 2)   | Ground.  |
| 8                | 4               | FSel             | Input      | Frequency Register selection control line. Internal $70k\Omega$ pull-down resistor.  |
| 9                | 5               | E_WR             | Input      | Enhancement Register write enable. Also functions as a Serial Port control line. Internal $70k\Omega$ pull-down resistor.  |
| 10               | 6               | V <sub>PP</sub>  | Input      | EEPROM erase/write programming voltage supply pin. Requires a 100pF bypass capacitor connected to GND.   |
| 11               | 7               | $V_{DD}$         | (Note 1)   | Same as pin 1.   |
| 12               | 8               | F <sub>in</sub>  | Input      | Prescaler input from the VCO.  |
| 13               | 9               | F <sub>in</sub>  | Input      | Prescaler complementary input. A series 50 $\Omega$ resistor and DC blocking capacitor should be placed as close as possible to this pin and connected to the ground plane.  |
| 14               |                 | GND              | (Note 2)   | Ground.  |
| 15               | 10              | C <sub>EXT</sub> | Output     | Logical "NAND" of PD_U and PD_D terminated through an on-chip, $2k\Omega$ series resistor. Connecting $C_{\text{EXT}}$ to an external capacitor will low pass filter the input to the inverting amplifier used for driving LD. |
| 16               | 11              | EELoad           | Input      | Control line for Serial Data Port, Frequency Register selection, EE Register parallel loading, and EEPROM programming. Internal 70k $\Omega$ pull-down resistor.   |
| 17               | 12              | LD               | Output, OD | Lock detect output, an open-drain logical inversion of $C_{\text{EXT}}$ . When the loop is in lock, LD is high impedance; otherwise, LD is a logic LOW.  |

| Pin No.<br>TSSOP | Pin No.<br>MLPQ | Pin Name       | Туре     | Description  |
|------------------|-----------------|----------------|----------|--|
| 18               | 13              | Dout           | Output   | Data out function. Dout is defined with the Enhancement Register and enabled with ENH.   |
| 19               | 14              | $V_{DD}$       | (Note 1) | Same as pin 1.   |
| 20               | 15              | PD_D           | Output   | Phase detector output. PD_D pulses negatively when fp leads fc.  |
| 21               | 16              | PD_U           | Output   | Phase detector output. PD_U pulses negatively when fc leads fp.  |
| 22               | 17              | EESel          | Input    | Control line for Frequency Register selection, EE Register parallel loading, and EEPROM programming. Internal 70k $\Omega$ pull-up resistor. |
| 23               |                 | GND            | (Note 2) | Ground.  |
| 24               | 18              | f <sub>r</sub> | Input    | Reference frequency input.   |

Notes 1: VDD pins 1, 11, and 19 (TSSOP) are connected by diodes and must be supplied with the same positive voltage level.

**Table 2. Absolute Maximum Ratings** 

| Symbol           | Parameter/Conditions         | Min  | Max                  | Units |
|------------------|------------------------------|------|----------------------|-------|
| $V_{DD}$         | Supply voltage               | -0.3 | +4.0                 | V     |
| Vı               | Voltage on any digital input | -0.3 | V <sub>DD</sub> +0.3 | V     |
| T <sub>Stg</sub> | Storage temperature range    | -65  | +85                  | °C    |

**Table 3. Operating Ratings** 

| Symbol         | Parameter/Conditions                | Min  | Max  | Units |
|----------------|-------------------------------------|------|------|-------|
| $V_{DD}$       | Supply voltage                      | 2.85 | 3.15 | V     |
| T <sub>A</sub> | Operating ambient temperature range | -55  | 85   | °C    |

# Table 4. ESD Ratings

| Symbol                                 | Parameter/Conditions                  | Min | Max  | Units |
|--|---------------------------------------|-----|------|-------|
| $V_{ESD}$                              | ESD voltage human body model (Note 1) |     | 1000 | V     |
| V <sub>ESD</sub><br>(V <sub>PP</sub> ) | ESD voltage human body model (Note 1) |     | 200  | V     |

Note 1: Periodically sampled, not 100% tested. Tested per MIL-STD-883, M3015 C2

# **Electrostatic Discharge (ESD) Precautions**

When handling this UTSi device, observe the same precautions that you would use with other ESD-sensitive devices. Although this device contains circuitry to protect it from damage due to ESD, precautions should be taken to avoid exceeding the rating specified in table 4.

# Latch-Up Avoidance

Unlike conventional CMOS devices, UTSi CMOS devices are immune to latch-up.

<sup>2:</sup> Ground connections are made through the exposed solder pad. The solder pad must be soldered to the ground plane for proper operation.

# **Table 5. DC Characteristics**

# $V_{\text{DD}}$ = 3.0 V, -55° C < $T_{\text{A}}$ < 85° C, unless otherwise specified

| Symbol                 | Parameter  | Conditions                                 | Min                   | Тур  | Max                   | Units |

- Note 1: f<sub>Clk</sub> is verified during the functional pattern test. Serial programming sections of the functional pattern are clocked at 10 MHz to verify f<sub>Clk</sub> specification.
- Note 2: Rise and fall times of the  $V_{PP}$  programming voltage pulse must be greater than 1  $\mu s$ .
- Note 3: CMOS logic levels can be used to drive F<sub>In</sub> input if DC coupled and used in Prescaler Bypass mode. Voltage input needs to be a minimum of 0.5 Vp-p. For optimum phase noise performance, the reference input falling edge rate should be faster than 80 mV/ns. No minimum frequency limit exists when operated in this mode.
- **Note 4:** CMOS logic levels can be used to drive reference input if DC coupled. Voltage input needs to be a minimum of 0.5 Vp-p. For optimum phase noise performance, the reference input falling edge rate should be faster than 80 mV/ns.
- Note 5: Parameter is guaranteed through characterization only and is not tested.

## **Functional Description**

The PE83342 consists of a dual modulus prescaler, three programmable counters, a phase detector and control logic with EEPROM memory (see Figure 1).

The dual modulus prescaler divides the VCO frequency by either 10 or 11, depending on the state of the internal modulus select logic. The R and M counters divide the reference and prescaler outputs by integer values stored in one of three selectable registers. The modulus select logic uses the 4-bit A counter.

The phase-frequency detector generates up and down frequency control signals and are also used to enable a lock detect circuit.

Frequency control data is loaded into the device via the Serial Data Port, and can be placed in three separate frequency registers. One of these registers (EE register) is used to load from and write to the non-volatile 20-bit EEPROM.

Various operational and test modes are available through the enhancement register, which is only accessible through the Serial Data Port (it cannot be loaded from the EEPROM).

#### **Main Counter Chain**

The main counter chain divides the RF input frequency, F<sub>in</sub>, by an integer derived from the userdefined values in the M and A counters. It operates in two modes:

#### High Frequency Mode

Setting PB (prescaler bypass) LOW enables the ÷10/11 prescaler, providing operation to 2.7 GHz. In this mode, the output from the main counter chain, f<sub>p</sub>, is related to the VCO frequency, F<sub>in</sub>, by the following equation:

$$f_p = F_{in} / [10 \text{ x } (M+1) + A]$$
 (1)  
where  $0 \le A \le 15$  and  $A \le M+1$ ;  $1 \le M \le 511$ 

When the loop is locked, F<sub>in</sub> is related to the reference frequency,  $f_r$ , by the following equation:

$$F_{in} = [10 \times (M+1) + A] \times (f_r / (R+1))$$
 (2)  
where  $0 \le A \le 15$  and  $A \le M+1$ ;  $1 \le M \le 511$ 

A consequence of the upper limit on A is that F<sub>in</sub> must be greater than or equal to 90 x ( $f_r$  / (R+1)) to obtain contiguous channels. Programming the M counter with the minimum value of 1 will result in a minimum M counter divide ratio of 2.

Programming the M and A counters with their maximum values provides a divide ratio of 5135.

## Prescaler Bypass Mode

Setting the PB bit of a frequency register HIGH allows F<sub>in</sub> to bypass the ÷10/11 prescaler. In this mode, the prescaler and A counter are powered down, and the input VCO frequency is divided by the M counter directly. The following equation relates F<sub>in</sub> to the reference frequency f<sub>r</sub>:

$$F_{in} = (M + 1) \times (f_r / (R+1))$$
 (3)  
where  $1 \le M \le 511$ 

#### **Reference Counter**

The reference counter chain divides the reference frequency, f<sub>r</sub>, down to the phase detector comparison frequency, f<sub>c</sub>.

The output frequency of the 6-bit R Counter is related to the reference frequency by the following equation:

$$f_c = f_r / (R+1)$$
where  $0 \le R \le 63$ 

Note that programming R with 0 will pass the reference frequency, f<sub>r</sub>, directly to the phase detector.

#### Phase Detector

The phase detector is triggered by rising edges from the main counter (f<sub>p</sub>) and the reference counter (f<sub>c</sub>). It has two outputs, PD U, and PD D. If the divided VCO leads the divided reference in phase or frequency (fp leads fc), PD\_D pulses LOW. If the divided reference leads the divided VCO in phase or frequency (f<sub>c</sub> leads f<sub>p</sub>), PD\_U pulses LOW. The width of either pulse is directly proportional to the phase offset between the f<sub>p</sub> and f<sub>c</sub> signals.

## **Lock Detect Output**

A lock detect signal is provided at pin LD, via the pin  $C_{\text{EXT}}$  (see Figure 1).  $C_{\text{EXT}}$  is the logical "NAND" of PD\_U and PD\_D waveforms, driven through a series 2k ohm resistor. When the loop is locked, this output will be HIGH with narrow pulses LOW. Connecting  $C_{\text{EXT}}$  to an external shunt capacitor provides integration of this signal.

The  $C_{\text{EXT}}$  signal is sent to the LD pin through an internal inverting comparator with an open drain output. Thus LD is an "AND" function of PD\_U and PD\_D.

Table 7. Serial Interface

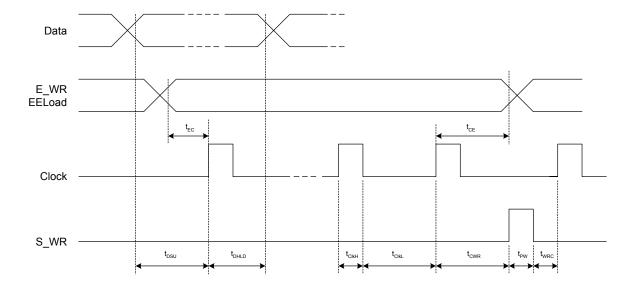

| S_WR | E_WR | EELoad | Register Loaded      |
|------|------|--------|----------------------|
| 0    | 0    | 0      | Primary Register     |
| 0    | 1    | 0      | Enhancement Register |
| 0    | Х    | 1      | EE Register          |

#### Serial Data Port

The Serial Data Port allows control data to be entered into the device. This data can be directed into one of three registers: the Enhancement register, the Primary register, and the EE register. Table 7 defines the control line settings required to select one of these destinations.

Input data presented on pin 5 (Data) is clocked serially into the designated register on the rising edge of Clock. Data is always loaded LSB ( $B_0$ ) first into the receiving register. Figure 3 defines the timing requirements for this process.

Figure 3. Serial Interface Timing Diagram

## **Frequency Registers**

There are three independent frequency registers, any one of which can be selected to control the operation of the device. Each register is 20 bits in length, and provides data to the three counters and the prescaler bypass control. Table 8 defines these bit assignments.

# Primary Register

The Primary Register is a serial shift register, loaded through the Serial Data Port. It can be selected to control the PLL as shown in Table 9. It is not buffered, thus when this register is selected to control the PLL, its data is continuously presented to the counters during a load operation.

This register is also used to perform a parallel load of data into the Secondary Register.

#### Secondary Register

The Secondary Register is a parallel-load register. Data is copied into this register from the Primary Register on the rising edge of S\_WR, according to the timing diagrams shown in Figure 3. It can be selected to control the PLL as shown in Table 9.

#### EE Register

The EE Register is a serial/parallel-in, serial/parallel-out register, and provides the

interface to the EEPROM. It is loaded from the Serial Data Port to provide the parallel data source when writing to the EEPROM. It also accepts stored data from the EEPROM for controlling the PLL.

Serial loading of the EE Register is done as shown in Table 7 and Figure 3. Parallel loading of the register from EEPROM is accomplished as shown in Table 10.

The EE register can be selected to control the PLL as shown in Table 9. Note that it cannot be selected to control the PLL using data that has been loaded serially. This is because it must first go through one of the two conditions in Table 10 that causes the EEPROM data to be copied into the EE Register. The effect of this is that only EEPROM data is used when the EE Register is selected.

The contents of the EE register can also be shifted out serially through the Dout pin. This mode is enabled by appropriately programming the Enhancement Register. In this mode, data exits the register on the rising edge of Clock, LSB (B<sub>0</sub>) first, and is replaced with the data present on the Data input pin. Tables 7 and 12 define the settings required to enable this mode.

Table 8. Primary / Secondary / EE Register Bit Assignments

| R <sub>5</sub> | R <sub>4</sub> | M <sub>8</sub> | M <sub>7</sub> | РВ             | M <sub>6</sub> | M <sub>5</sub> | M <sub>4</sub> | M <sub>3</sub> | M <sub>2</sub> | M <sub>1</sub>  | Mo              | R <sub>3</sub>  | R <sub>2</sub>  | R <sub>1</sub>  | R <sub>0</sub>  | <b>A</b> <sub>3</sub> | A <sub>2</sub>  | <b>A</b> <sub>1</sub> | A <sub>0</sub>  |

| EESel | EELoad | Function             |
|-------|--------|----------------------|
| _/_   | 0      | EEPROM → EE Register |
| 1     |        | EEPROM → EE Register |

## **Enhancement Register**

The Enhancement Register is a buffered serial shift register, loaded from the Serial Data Port. It activates special test and operating modes in the PLL. The bit assignments for these modes are shown in Table 11.

The functions of these Enhancement Register bits are shown in Table 12. A function becomes active when its corresponding bit is set HIGH. Note that bits 1, 2, 5, and 6 direct various data to the Dout

pin, and for valid operation no more than one should be set HIGH simultaneously.

The Enhancement Register is buffered to prevent inadvertent control changes during serial loading. Data that has been loaded into the register is captured in the buffer and made available to the PLL on the falling edge of E\_WR.

A separate control line is provided to enable and disable the Enhancement mode. Functions are enabled by taking the ENH control line LOW.

**Table 11. Enhancement Register Bit Assignments** 

| Reserved       | EE Register<br>Output |                |                | Counter<br>load | MSEL<br>output | f <sub>c</sub> output | Reserved       |
|----------------|-----------------------|----------------|----------------|-----------------|----------------|-----------------------|----------------|

**Table 12. Enhancement Register Functions** 

| Bit Function |                       | Description   |  |
|--------------|-----------------------|---|--|
| Bit 0        | Reserved              | Program to 0  |  |
| Bit 1        | EE Register Output    | Allows the contents of the EE Register to be serially shifted out Dout, LSB $(B_0)$ first. Data is shifted on rising edge of Clock. |  |
| Bit 2        | f <sub>p</sub> output | Provides the M counter output at Dout.  |  |
| Bit 3        | Power down            | Powers down all functions except programming interface.   |  |
| Bit 4        | Counter load          | Immediate and continuous load of counter programming.   |  |
| Bit 5        | MSEL output           | Provides the internal dual modulus prescaler modulus select (MSEL) at Dout.   |  |
| Bit 6        | f <sub>c</sub> output | Provides the R counter output at Dout.  |  |
| Bit 7        | Reserved              | Program to 0  |  |

## **EEPROM Programming**

Frequency control data that is present in the EE Register can be written to the non-volatile EEPROM. All 20 bits are written simultaneously in a parallel operation. The EEPROM is guaranteed for at least 100 erase/write cycles.

#### Erase Cycle

The EEPROM should be taken through an erase cycle before writing data, since the write operation performs a logical AND of the EEPROM's current contents with the data in the EE Register. Erasing the EEPROM is accomplished by holding the S\_WR, EESel, and EELoad inputs HIGH, then applying one ERASE programming voltage pulse to the  $V_{PP}$  input (see Table 13). The voltage source for this operation must be capable of supplying the EEPROM erase cycle current ( $I_{PP}$ \_ERASE, Table 5). The timing diagram is shown in Figure 4.

**Table 13. EEPROM Programming** 

| S_WR | EESel | EELoad | $V_{PP}$      | Function    |
|------|-------|--------|---------------|-------------|
| 1    | 1     | 1      | 25ms @ -8.5V  | Erase cycle |
| 1    | 0     | 1      | 25ms @ +12.5V | Write cycle |

Figure 4. EEPROM Erase Timing Diagram

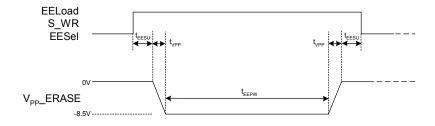

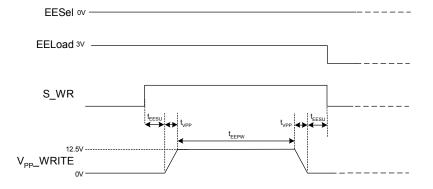

Figure 5. EEPROM Write Timing Diagram

#### Write Cycle

Using the Serial Data Port, the EE Register is first loaded with the desired data. The EEPROM is then programmed with this data by taking the S\_WR input HIGH and EESel input LOW, then applying one WRITE programming voltage pulse to the V<sub>PP</sub> input. The voltage source for this operation must be capable of supplying the EEPROM write cycle current (I<sub>PP</sub>\_WRITE, Table 5). The timing diagram of this operation is shown in Figure 5. Programming is completed by taking the EELoad input LOW.

Note that it is possible to erroneously overwrite the EE Register with the EEPROM contents before the write cycle begins by unneeded manipulation of the EELoad bit (see Table 10).

## **Application Information**

The PE83342 has been designed to allow a self-starting PLL synthesizer to be built, removing the need to have a micro-controller or other programming source load data into the device on power-up. It can be used as a remotely controllable PLL as well, since the EEPROM circuitry has been added to a complete PLL core (PE3339).

The PE83342's EEPROM can be programmed incircuit, or prior to assembly using a socketed fixture. It can be reprogrammed a minimum of 100 times, but is not designed to support constant reprogramming of the EEPROM by an application.

## Self-Starting Mode

In self-starting applications, the EE Register is used to control the device and must be selected per Table 9. Additionally, the contents of the EEPROM must be copied to the EE Register per Table 10, and device power must be stable for this transfer to be reliably accomplished. These requirements can be met by connecting a capacitor of 50pF-10uF (evaluation design uses 3.3uF) from the EESel pin to ground. The delay of the rising edge on EESel, created by the RC time constant of its 70k ohm internal pull-up resistor and the external capacitor, will allow device power to stabilize first, ensuring proper data transfer. This edge is adaptable by capacitor value selection. The Vcc applied to the IC must be settled first.

#### **Evaluation and Programming Kit Support**

To provide easy evaluation of the PE83342 and to also enable programming of small evaluation quantities, Peregrine has developed complete evaluation kits and programming kits for the PE83342 EEPROM PLLs.

#### Evaluation Kits

The evaluation kits consist of an evaluation board and support software enabling the user to evaluate the full functionality of the part. The EEPROM can be loaded with user specified values and then placed in a self start-up mode. Please refer to Table 14, Ordering Information, for the specific order codes.

#### Programming Kits

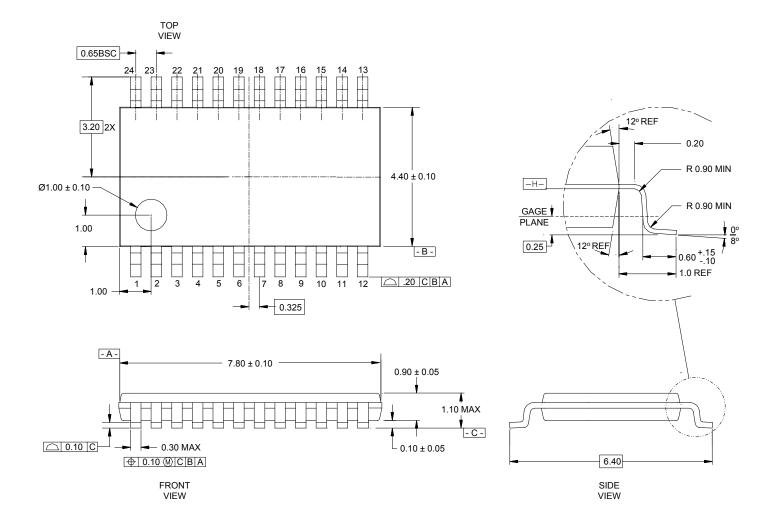

The programming kits consist of a programming board and support software that enables the user to program small quantities of devices for prototype evaluation and for small pre-production runs. Please refer to Table 14, Ordering Information, for the specific order codes

Large production quantities can be special programmed at Peregrine for an additional charge. Please contact Peregrine Sales for pricing and leadtime at sales@peregrine-semi.com.
